

ACOUSTIC DETECTION OF DRONES USING MACHINE LEARNING

STUDENT: ÖMER EKİNCİ | SUPERVISOR: PROF. DR. EMRE AKTAŞ

INTRODUCTION

Detection of unmanned aerial vehicles has recently become an important security issue. In this project, a system will be designed using machine learning methods that detect the aircraft based on the sound waves they produce. The final result of the project consists of a real-time detector that listens to the environment and alarms if there is a drone. The final result consists of both the hardware of the system and the algorithms that run on it.

SOLUTIONS METHODOLOGY

- 1 GATHERING SOUND RECORDS
- 2 DECIMATION
- 3 SEGMENTATION & FRAMING
- 4 WINDOWING & FFT
- 5 MEL-SPECTROGRAM & MEL-FILTER BANK
- 6 DATA SEPERATION
- 7 MODEL PARAMETER TUNING
- 8 MODEL TRAINING
- 9 TRACKING ALGORITHM
- 10 REAL-TIME DETECTION

RESULTS AND DISCUSSIONS

We successfully completed our model with the signal processing and machine learning techniques that we applied in our project. The features of the system we created are as follows:

- ▶ Optimal operation range is between 0-50 meters.
- ▶ Maximum range is 100 meters.
- ▶ Stable against to air conditions.
