Frequency Response of Amplifiers First-Order RC Filters

First-Order Highpass RC Filter

Consider the first order highpass (HP) RC circuit given below, let us calculate the voltage gain $A=v_o/v_i$. Note that, as the impedance of the capacitor changes with the frequency the gain will change with the frequency.

$$\begin{split} A(\omega) &= \frac{v_o}{v_i} = \frac{R}{R + Z_C} \\ &= \frac{1}{1 + \frac{Z_C}{R}} \\ &= \frac{1}{1 - j^{-\frac{1}{1 - j}}} \end{split}$$

$$... Z_C = -jX_C = -j\frac{1}{\omega C}$$

$$\ldots \omega = 2\pi f$$

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I

02-May-2018

quency Response of Amplifiers First-Order RC Filters

$$A(\omega) = \frac{1}{1 - j\frac{1}{\omega CR}}$$

 $A(\omega)$ is called frequency response of the filter circuit above. As the frequency response $A(\omega)$ is complex, it has a magnitude and phase, i.e.,

$$A(\omega) = |A(\omega)| \, e^{j \angle A(\omega)}$$

Thus, $A(\omega)$ is called the frequency response, $|A(\omega)|$ is called the magnitude response and $\angle A(\omega)$ is called the phase response

Given that we know the frequency response of the system. Then, for a sinusoidal input $v_i(t)$

$$v_i(t) = V_m \cos(\omega_0 t)$$
,

we obtain the output signal $v_o(t)$ as

$$v_o(t) = |A(\omega_0)|V_m \cos(\omega_0 t + \angle A(\omega_0))$$
.

So, the magnitude and phase of the output determined by the frequency response of the system.

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I

$$A(\omega) = \frac{1}{1 - j\frac{1}{\omega CR}}$$

For this highpass system given above, magnitude response $|A(\omega)|$ and phase response $\angle A(\omega)$ are given by

$$\begin{split} |A(\omega)| &= \frac{1}{\sqrt{1 + \frac{1}{\omega^2 R^2 C^2}}} \\ \angle A(\omega)| &= \arctan\left(\frac{1}{\omega RC}\right) \end{split}$$

Note that $\omega\to\infty\Rightarrow |A(\omega)|\to 1$ and $\omega\to 0\Rightarrow |A(\omega)|\to 0$

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I 02-May-2018 4 / 48

Cutoff Frequency

$$\boxed{|A(\omega)| = \frac{1}{\sqrt{1 + \frac{1}{\omega^2 R^2 C^2}}}}$$

The frequency where the output power drops to half (of the maximum output power) is called the cutoff frequency or corner frequency, ω_c . Thus, at the cutoff frequency, the output voltage gain magnitude square will drop to half. As, in this case the maximum gain is one, i.e. $\max |A(\omega)| = 1$,

$$|A(\omega_c)|^2 = \frac{1}{2}$$

$$\frac{1}{1 + \frac{1}{\omega_c^2 R^2 C^2}} = \frac{1}{2}$$

...i.e.,
$$|A(\omega_c)|=rac{1}{\sqrt{2}}$$

02-May-2018 3 / 48

$$\omega_c = \frac{1}{RC}$$

$$\dots f_c = \frac{1}{2\pi RC}$$

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I 02-May-2018 5 / 48

Consequently, frequency response of the highpass filter $A(\omega)$ is given by

$$A(\omega) = \frac{1}{1 - j\frac{\omega_c}{\omega}}$$

$$|A(\omega)| = \frac{1}{\sqrt{1 + \frac{\omega_c^2}{\omega^2}}}$$

$$\angle A(\omega)| = \arctan\left(\frac{\omega_c}{\omega}\right)$$

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I

02-May-2018

$$|A(\omega)| = \frac{1}{\sqrt{1 + \frac{\omega_c^2}{\omega^2}}}$$

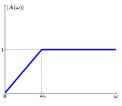

Amplitude response above has two asymptotes as shown below

$$\frac{\omega_c^2}{\omega^2} \ll 1 \Rightarrow |A(\omega)| = 1$$

$$\frac{\omega^2}{\omega^2} \gg 1 \Rightarrow |A(\omega)| = \frac{\omega}{\omega_c}$$

$$\dots |A(\omega_c)| = \frac{\omega_c}{\omega_c} = 1$$

These two lines intersect at $\omega = \omega_c$ as shown below.

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I

02-May-2018 7 / 48

Frequency Response of Amplifiers First-Order RC Filters

Decibels (dB)

The decibel (dB) is a logarithmic unit used to express the ratio of two values of a physical quantity, often power or intensity. One of these values is often a standard reference value, in which case the decibel is used to express the level of the other value relative to this reference. The term decibel has its origin in the fact that power and audio levels are related on a logarithmic basis, i.e.,

$$G_{dB} = 10 \log_{10} \frac{P_o}{P_i}$$
$$= 20 \log_{10} \frac{V_o}{V_o}$$

$$\dots P = \frac{V^2}{R}$$

Thus, magnitude response in decibels is given by

$$A(\omega)|_{\mathsf{dB}} = 20\log_{10}|A(\omega)|$$

Consequently, the normalized $\mbox{\it magnitude response}$ (i.e., maximum value is 1) in decibels is given by

$$|\tilde{A}(\omega)|_{\mathsf{dB}} = 20 \log_{10} \frac{|A(\omega)|}{\max |A(\omega)|}$$

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I

02-May-2018 8 / 48

Frequency Response of Amplifiers First-Order RC Filters

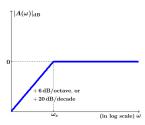

$$|A(\omega)| = \frac{1}{\sqrt{1 + \frac{\omega_c^2}{\omega^2}}}$$

The two asymptotes of the amplitude response above are expressed in dB as follows

$$\frac{\omega_c^2}{\omega^2} \ll 1 \Rightarrow 20 \log_{10} 1 = 0 \, \mathsf{dB}$$

$$\frac{\omega_c^2}{\omega^2} \gg 1 \Rightarrow |A(\omega)| = 20 \log_{10} \frac{\omega}{\omega_c} = 20 \log_{10} \omega - 20 \log_{10} \omega_c$$

These two lines intersect at $\omega=\omega_c$ as shown below.

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I

02-May-2018 9 / 48

Frequency Response of Amplifiers First-Order RC Filters

Let us consider the second asymptote (i.e., $20\log_{10}\frac{\omega}{\omega_c}$) and for a given $\omega=\omega_1$ consider the two cases where $\omega_2=\omega_1/2$ and $\omega_3=\omega_1/10$, then

$$\begin{array}{ll} 20 \log_{10} \frac{\omega_2}{\omega_c} = 20 \log_{10} \frac{\omega_1}{\omega_c} - 20 \log_{10} 2 \cong 20 \log_{10} \frac{\omega_1}{\omega_c} - 6 \, \mathrm{dB} & \dots \mathrm{one} \ \mathrm{octave} \\ \\ 20 \log_{10} \frac{\omega_3}{\omega_c} = 20 \log_{10} \frac{\omega_1}{\omega_c} - 20 \log_{10} 10 = 20 \log_{10} \frac{\omega_1}{\omega_c} - 20 \, \mathrm{dB} & \dots \mathrm{one} \ \mathrm{decade} \end{array}$$

A change in frequency by a factor of \mathbf{two} is equivalent to one \mathbf{octave} . Similarly, a change in frequency by a factor of \mathbf{ten} is equivalent to one \mathbf{decade} .

Thus, the slope of the second asymptote (i.e., $20\log_{10}\frac{\omega}{\omega_c}$) is $6\,\mathrm{dB/octave}$ or $20\,\mathrm{dB/decade}$.

So, actual magnitude of the normalized magnitude response at the cutoff frequency ω_c is $|\tilde{A}(\omega_c)|=1/\sqrt{2}$. Thus, in dBs

$$20\log_{10}|\tilde{A}(\omega_c)| = 20\log_{10}\frac{1}{\sqrt{2}} \cong -3\,\mathrm{d}\,\mathrm{B}$$

Thus, cutoff frequency is always 3dB below the maximum gain.

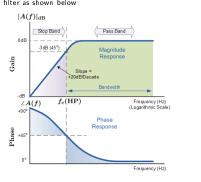

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I

02-May-2018 10 / 48

 $\dots Z_C = -jX_C = \frac{1}{j\omega C}$ $\dots \omega = 2\pi f$

As a result if we plot above against ω , we obtain the **magnitude** and **phase** responses of the first order highpass RC filter as shown below.

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I

02-May-2018 11 / 48

Frequency Response of Amplifiers First-Order RC Filters

First-Order Lowspass RC Filter

Consider the first order lowpass (LP) RC circuit given below, let us calculate the voltage gain $A=v_{\rm o}/v_i$. Note that, as the impedance of the capacitor changes with the frequency the gain will change with the frequency.

$$A(\omega) = \frac{v_o}{v_i} = \frac{Z_C}{Z_C + R}$$

$$= \frac{1}{1 + \frac{R}{Z_C}}$$

$$= \frac{1}{1 + j\omega CR}$$

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I 02-May-2018 12 / 48

Frequency Response of Amplifiers First-Order RC Filters

$$A(\omega) = \frac{1}{1 + j\omega CR}$$

Thus, magnitude response $|A(\omega)|$ and phase response $\angle A(\omega)$ are given as

$$|A(\omega)| = \frac{1}{\sqrt{1 + \omega^2 R^2 C^2}}$$

$$\angle A(\omega)| = -\arctan(\omega RC)$$

Note that $\omega \to \infty \Rightarrow |A(\omega)| \to 0$ and $\omega \to 0 \Rightarrow |A(\omega)| \to 1$.

Cutoff frequency ω_c can be found as,

$$\begin{aligned} |A(\omega_c)|^2 &= \frac{1}{2} & \dots \text{i.e.. } |A(\omega_c)| &= \frac{1}{\sqrt{2}} \\ \frac{1}{1+\omega_c^2 R^2 C^2} &= \frac{1}{2} \\ & \omega_c &= \frac{1}{RC} & \dots f_c &= \frac{1}{2\pi RC} \end{aligned}$$

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I

Frequency Response of Amplifiers First-Order RC Filters

$$\boxed{A(\omega) = \frac{1}{1 + j\omega CR}}$$

Consequently, frequency response of the lowpass filter $A(\omega)$ is given by

$$A(\omega) = \frac{1}{1 + j\frac{\omega}{\omega_c}}$$

$$|A(\omega)| = \frac{1}{\sqrt{1 + \frac{\omega^2}{\omega_c^2}}}$$

$$\angle A(\omega)| = -\arctan\left(\frac{\omega}{\omega_c}\right)$$

 16 / 48

Frequency Response of Amplifiers Typical Frequency Response

The magnitudes of the gain response curves of an RC-coupled amplifier system are given below in the plot low-, high-, and mid-frequency regions are defined.

Frequency Response of Amplifiers $|A(\omega)| = \frac{1}{\sqrt{1 + \frac{\omega^2}{\omega_c^2}}}$ $\mathbf{v}_i \qquad \mathbf{c} \qquad \mathbf{v}_e \qquad \qquad \mathbf{z}$ $\mathbf{z} = \mathbf{d}(\omega) = -\arctan\left(\frac{\omega}{\omega_c}\right)$

As a result if we plot above against ω , we obtain the **magnitude** and **phase** responses of the first order lowpass RC filter as shown below.

The purpose of frequency analysis in this course is to determine the low-frequency cutoff f_L and the high-frequency cutoff f_H of the amplifier. Low-frequency cut-off f_L is determined by the capacitors in the circuit, i.e., C_1 , C_2 and C_3 , and high-frequency cutoff f_H is determined by the internal device capacitances, wiring capacitances or parasitic capacitances.

Consequently, low-frequency capacitors are short-circuit for high-frequency, and high-frequency capacitances are open-circuit for low-frequency. So, low-frequency response and high-frequency response will be dealt with separately. The **bandwidth** (or passband, or midband) of the amplifier is determined as

 $\boxed{\mathsf{Bandwidth}\; (\mathsf{BW}) = f_H - f_L}$

$$\boxed{f_{L_3} = \frac{1}{2\pi R_{eq_3} C_3}}$$

where R_{eq3} is the Thévenin resistance seen by C_3 (i.e., like the output resistance of the emitter-follower), value of which for this circuit is given by

$$R_{eq_3} = R_E || \frac{R_s ||R_1|| R_2 + h_{ie}}{h_{fe} + 1}.$$

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I

02-May-2018 23 / 48

Frequency Response of Amplifiers Low Frequency Response

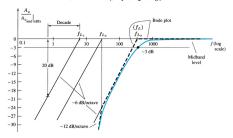

Combined Effect of C_1 , C_2 and C_3

Each cutoff frequency f_{L_1} , f_{L_2} and f_{L_3} adds an additional 6dB/octave slope as shown below. Overall cutoff frequency f_L is higher than the highest value of these three cutoff frequencies, i.e.,

$$f_L \ge \max (f_{L_1}, f_{L_2}, f_{L_3})$$

When the three cut-off frequencies (or the highest cutoff frequency) are a decade apart from each other, than the overall cutoff frequency is almost equal to the highest of these three frequencies as depicted in the figure below, i.e.,

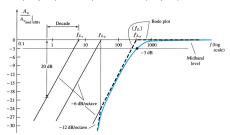

$$f_L \approx \max \left(f_{L_1}, f_{L_2}, f_{L_3}\right)$$

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I

02-May-2018 24 / 48

Frequency Response of Amplifiers Low Frequency Response

As R_{eq_3} normally has the lowest resistance value, generally f_{L_3} holds the highest value. Also as generally $R_i>R_o$, mostly $f_{L_2}>f_{L_1}$. So, generally $f_{L_3}>f_{L_2}>f_{L_1}$.

Even though these assumptions may not hold, we generally select the value of the capacitors $C_1,\ C_2$ and C_3 properly to have the cutoff frequencies to be at least a decade apart, e.g., $f_{L_3}>10f_{L_2}>10f_{L_1}$, in order to reduce the coupling effect of all three capacitors to the cutoff frequency f_{L} .

If the decade-apart condition do not hold, then the cutoff frequency f_L will move up towards the mid-frequency range and has to be calculated from the overall third-order highpass system by considering the effects of all three-capacitors.

Frequency Response of Amplifiers Miller Effect

Miller Effect

For inverting amplifiers (phase shift of 180° between input and output, resulting in a negative value for A_v), the input and output capacitance is increased by a capacitance level sensitive to the interelectrode capacitance between the input and output terminals of the device and the gain of the amplifier. Thus, Miller effect only occurs in common-emitter and common-source am plifiers

Capacitance C_f between input and output will be represented by its equivalent Miller capacitance at the input C_{M_i} and at the output C_{M_o} .

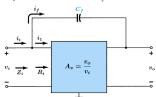

For noninverting amplifiers such as the common-base and emitter-follower (or common-gate and source-follower) configurations, the Miller effect capacitance is not a contributing concern for high-frequency applications.

Miller Output Capacitance C_{M_a}

Consider the network shown above, let us calculate the output impedance $Z_o=v_o/i_o$

$$\begin{split} Z_o &= \frac{v_o}{i_o} = \frac{v_o}{i_1 + i_f} & \dots i_1 = \frac{v_o}{R_o}, i_f = \frac{v_o - v_i}{Z_{C_f}} \\ &= \frac{v_o}{v_o/R_o + \frac{v_o - v_o/A_v}{Z_{C_f}}} & \dots v_o = A_v v_i, Z_{C_f} = \frac{1}{j\omega C_f} \\ &= R_o || \frac{Z_{C_f}}{1 - \frac{1}{A_v}} & \dots Z_{M_o} = \frac{Z_{C_f}}{1 - \frac{1}{A_v}} \\ &= R_o || Z_{M_o} & \dots Z_{M_o} = \frac{1}{j\omega C_{M_o}}, C_{M_o} = \left(1 - \frac{1}{A_v}\right) C_f \end{split}$$

Frequency Response of Amplifiers Miller Effect

So, Miller output capacitance $C_{M_{lpha}}$ is given by

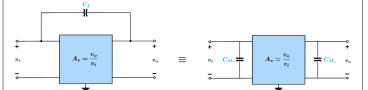

$$C_{M_o} = \left(1 - \frac{1}{A_v}\right) C_f \cong C_f$$

Thus, the feedback capacitance C_f appears as a similar capacitance at the output. Note that, $A_v < 0$ and $|A_v| \gg 1$

High Frequency Response - BJT Amplifiers

For the high-frequency circuit shown below, there are two factors that define the $-3\,\mathrm{dB}$ cutoff point: the ingli-requesty click shown below, there are two factors that define the -3ds cutoff point: the entwork capacitance (parasitic (C_{be}, C_{bc}, C_{ce}) and wiring (C_{W_i}, C_{W_o}) capacitance) and the frequency dependence of h_{fe} (or β). Note that, low-frequency capacitors C_1 , C_2 and C_3 are short circuit and have no effect in high-frequency analysis.

Frequency Response of Amplifiers High Frequency Respons

Combined Effect of f_{H_1} , f_{H_2} and f_{β} Each cutoff frequency f_{H_1} , f_{H_2} and f_{β} adds an additional 6dB/octave slope as shown below. Overall cutoff frequency f_H is lower than the lowest value of these three cutoff frequencies, i.e.,

$$f_H \le \min (f_{H_1}, f_{H_2}, f_{\beta})$$

When the three cut-off frequencies (or the lowest cutoff frequency) are a decade apart from each other, than the overall higher cutoff frequency f_H is almost equal to the lowest of these three frequencies as depicted in the figure below, i.e.,

$$f_{H}\approx\min\left(f_{H_{1}},f_{H_{2}},f_{\beta}\right)$$

Dr. U. Sezen & Dr. D. Gökcen (Hacettepe Uni.) ELE230 Electronics I

02-May-2018

As Miller input capacitance C_{M_i} has the highest capacitance, almost always f_{H_1} holds the lowest value. Also not always, but generally $f_{eta} < f_{H_2}$.

Frequency Response of Amplifiers Gain-Bandwidth Product

Gain-Bandwidth Product

There is a **Figure of Merit** applied to amplifiers called the **Gain-Bandwidth Product** (**GBP**) that is commonly used to initiate the design process of an amplifier. It provides important information about the relationship between the gain of the amplifier and the expected operating frequency range.

The gain-bandwidth product of an amplifier is **constant**. Thus, gain and bandwidth are inversely proportional, i.e., when we increase the gain, the bandwidth decreases. As a result, we can express the gain-bandwidth product (GBP) as follows

$$\begin{split} \mathsf{GBP} &= A_{v_{mid}} \mathsf{BW} & \dots \mathsf{BW} = f_H - f_L \\ &\cong A_{v_{mid}} f_H & \dots f_H \gg f_L \end{split}$$

For example, f_T is the gain-bandwidth product for f_β as it is the cutoff frequency for $h_{fe}=1$, i.e., $f_lpha\cong f_T$.
